# NOTE ON POLYNOMIALS

# KEISUKE HOSHINO

**Notation 0.1.** We employ the following notations.

- Sets are regarded as discrete categories, and categories are regarded as locally discrete 2-categories.
- Set is the large category of small sets.
- We write  $\mathfrak{CMT}$  for the huge 2-category of large categories.
- For each set S and a functor  $X: S \longrightarrow \mathbf{Set}$ , we write  $X_s$  for the image of  $s \in S$  under X. Moreover, we write  $(X_s)_{s:S}$  for X.
- For each set S and functors  $X, Y: S \longrightarrow \mathbf{Set}$ , a natural transformation  $f: X \Longrightarrow Y$  is denoted as a family of functions  $(f_s)_{s:S}$ .
- We write 1 for the terminal set, and we write \* for the unique element in 1.

## 1. POLYNOMIALS

**Definition 1.1.** We define a category **Poly** by the Grothendieck construction of the following 2-functor.

$$\mathbf{Set}^{\mathsf{op}} \xrightarrow{[-,\mathbf{Set}]^{\mathsf{op}}} \mathfrak{CMT}$$

A *polynomial* is an object in **Poly**. We write

$$(-)_{\circ} : \mathbf{Polv} \longrightarrow \mathbf{Set}$$

for the fibration corresponding to the 2-functor. For each polynomial A, we write  $A = \sum_{a:A_o} y^{A_a}$ . In particular, we mean by y the polynomial satisfying  $(y)_o = 1$  and  $(y)_* = 1$ .

**Definition 1.2.** We define a category **Fam** by the Grothendieck construction of the following 2-functor.

$$\mathbf{Set}^{\mathsf{op}} \xrightarrow{\quad [-,\mathbf{Set}] \quad} \mathfrak{CAT}$$

Note that the fibration  $Poly \longrightarrow Set$  is the fibrewise opposit of  $Fam \longrightarrow Set$ .

**Definition 1.3.** Consider the composite

where  $\Delta \colon \mathbf{Set} \longrightarrow [S, \mathbf{Set}]$  in the former is the diagonal and the latter is the internal hom for [S, Set]. This is natural in  $S \in \mathbf{Set}^{op}$  and induces a functor  $\mathbf{Poly} \times \mathbf{Set} \longrightarrow \mathbf{Fam}$ . We write  $\mathbf{rep} \colon \mathbf{Poly} \longrightarrow [\mathbf{Set}, \mathbf{Set}]$  for the currying of the composite

$$\begin{array}{ccc} \mathbf{Poly} \times \mathbf{Set} & \longrightarrow \mathbf{Fam} & \stackrel{\Sigma}{\longrightarrow} \mathbf{Set} \\ & & & & & & & \\ (A,S) & \longmapsto & \sum_{a:A_{\mathbf{o}}} \left[A_{p},S\right] \end{array}$$

where  $\sum$  is the coproduct (i.e., the left adjoint of the fibred terminal **Set**  $\longrightarrow$  **Fam**).

**Proposition 1.4.** rep is fully faithful.

Date: April 29, 2024.

*Proof.* Suppose we are given  $P, Q \in \mathbf{Poly}$ , a morphism  $\alpha \colon \mathbf{rep}(P) \longrightarrow \mathbf{rep}(Q)$  in  $[\mathbf{Set}, \mathbf{Set}]$ , and  $S \in \mathbf{Set}$ . We have the following commutative square:

$$\begin{array}{ccc} \sum_{p \in P_{\mathbf{0}}}[P_{p},S] & \xrightarrow{\alpha_{S}} & \sum_{q \in Q_{\mathbf{0}}}[Q_{q},S] \\ & & & \downarrow \operatorname{rep}(P)(!_{S}) \downarrow & & \downarrow \operatorname{rep}(Q)(!_{S}) \\ & & & P_{\mathbf{0}} & \xrightarrow{\alpha_{1}} & Q_{\mathbf{0}} \end{array}$$

where the left and the right vertical arrows are projections. Therefore, we have a family of morphisms  $[P_p, S] \longrightarrow [Q_{\alpha_1(p)}, S]$  natural in  $p \in P_o$  and  $S \in \mathbf{Set}$ . By applying the yoneda lemma, we obtain  $Q_{\alpha_1(p)} \longrightarrow P_p$  for each  $p \in P_o$ , which induces a morphism  $\bar{\alpha} \colon P \longrightarrow Q$  in **Poly**. One can readily check that  $\bar{\alpha}$  is a unique morphism satisfying  $\mathbf{rep}(\bar{\alpha}) = \alpha$ .

**Lemma 1.5.** (The essential image of) rep is closed under the monoidal structure  $(\circ, id_{Set})$  on [Set, Set].

*Proof.*  $rep(y) \cong id_{Set}$  is trivial. It suffices to show rep is closed under  $\circ$ . Let A, B be polynomials. Let us define another polynomial  $A \triangleleft B$  as follows.

$$(A \triangleleft B)_{o} = \sum_{a:A_{o}} [A_{a}, B_{o}]$$
$$(A \triangleleft B)_{a,t} = \sum_{u:A_{a}} B_{t(u)}$$

for any  $a: A_o$  and  $t: A_a \longrightarrow B_o$ . Then, observe the following bijections.

$$\begin{split} \operatorname{rep}(A \triangleleft B)(S) &\cong \sum_{a:A_{\mathfrak{o}}} \sum_{t:[A_{a},B_{\mathfrak{o}}]} \left[ \sum_{u:A_{a}} B_{t(u)}, S \right] \\ &\cong \sum_{a:A_{\mathfrak{o}}} \sum_{t:[A_{a},B_{\mathfrak{o}}]} \prod_{u:A_{a}} \left[ B_{t(u)}, S \right] \\ &\cong \sum_{a:A_{\mathfrak{o}}} \prod_{u:A_{a}} \sum_{b:B_{\mathfrak{o}}} \left[ B_{b}, S \right] \\ &\cong \sum_{a:A_{\mathfrak{o}}} \left[ A_{a}, \sum_{b:B_{\mathfrak{o}}} \left[ B_{b}, S \right] \right] \\ &= \operatorname{rep}(A)(\operatorname{rep}(B)(S)) \end{split}$$

The third bijection is the distributive law. Since these are natural in  $S \in \mathbf{Set}$  this shows that  $\mathbf{rep}(A \triangleleft B) \cong \mathbf{rep}(A) \circ \mathbf{rep}(B)$ .

**Proposition 1.6.** Let V be a category and W be a monoidal category. Suppose there is a fully faithful functor  $F \colon V \hookrightarrow W$  that is closed under the monoidal structure on W. Then there exists a monoidal structure on V that makes F strong monoidal, which is unique up to isomorphisms.

# Remark 1.7.

**Proposition 1.8.** (Poly,  $\triangleleft$ , y) is a monoidal category such that rep: Poly  $\longrightarrow$  ([Set, Set],  $\circ$ , id<sub>Set</sub>) is a pseudo monoidal functor.

*Proof.* Follows from Lemma 1.5 and Propositions 1.4 and 1.6.

The functor  $- \triangleleft -: \mathbf{Poly} \times \mathbf{Poly} \longrightarrow \mathbf{Poly}$  acts on morphisms as follows. Let  $F: A \longrightarrow X$ ,  $G: B \longrightarrow Y$  be morphisms in  $\mathbf{Poly}$ .

$$(F \triangleleft G)_{\mathbf{o}} \colon \sum_{a:A_{\mathbf{o}}} [A_a, B_{\mathbf{o}}] \longrightarrow \sum_{x:X_{\mathbf{o}}} [X_x, Y_{\mathbf{o}}] \colon (a,t) \mapsto (F_{\mathbf{o}}(a), F_a \circ t \circ G_{\mathbf{o}})$$

$$(F \triangleleft G)_{a,t} \colon \sum_{v:X_{F_{\mathbf{o}}}(a)} Y_{G_{\mathbf{o}}(t(F_a(v)))} \longrightarrow \sum_{u:A_a} B_{t(u)} \colon (v,r) \mapsto (F_a(v), G_{t(F_a(v))}(r))$$

**Lemma 1.9.** Poly  $\times$  Poly  $\xrightarrow{\triangleleft}$  Poly restricts to a functor Poly  $\times$  Set  $\xrightarrow{\triangleleft}$  Set and coincides with the uncurrying of rep.

Proof.

# 2. Double categories

By *double categories*, we mean psuedo ones.

**Definition 2.1.** A double category  $\mathbb{D}$  is a *company* if its tight arrows have companions.  $\mathbb{D}$  is an *opcompany* if  $\mathbb{D}^{hop}$  is a company. We say  $\mathbb{D}$  is an *equipment* if  $\mathbb{D}$  and  $\mathbb{D}^{hop}$  are companies.

**Definition 2.2.** (It is defined for arbitrary bvdc whose underlying sdc is a opcompany.) Let  $\mathbb{D}$  be an opcompany. Define another double category  $\mathbb{R}\text{et}(\mathbb{D})$  as follows.

- The vertical category is the same as  $\mathbb{D}$ .
- A loose arrow is a loose arrow in  $\mathbb{D}$ .
- A cell

$$\begin{array}{ccc} A & \stackrel{p}{\longrightarrow} & B \\ f \downarrow & \alpha & \downarrow g & \text{in } \mathbb{R}\mathrm{et}(\mathbb{D}) \\ X & \stackrel{1}{\longrightarrow} & Y \end{array}$$

is a cell in  $\mathbb{D}$  of the following form.

$$\begin{array}{cccc} X & \stackrel{q}{\longrightarrow} Y & \stackrel{g^*}{\longrightarrow} B \\ \parallel & \alpha & \parallel \\ X & \stackrel{}{\longrightarrow} A & \stackrel{}{\longrightarrow} B \end{array}$$

- horizontal composite
- vertical composite

**Proposition 2.3.** The virtual double category of monoids in  $\mathbb{R}et(\mathbb{D})^{\text{vop}}$  is representable if  $\mathbb{D}$  has local reflexive coequalizers.

**Definition 2.4.** Let  $\mathbb{D}$  be a double category with local reflexive coequalizers.

- We write  $Mod(\mathbb{D})$  for the double category corresponding to the representable virtual double category of monoids in  $Ret(\mathbb{D})$ .
- We write  $\operatorname{Mod_{co}}(\mathbb{D})$  for the vertical opposite of the double category corresponding to the representable virtual double category of monoids in  $\operatorname{Ret}(\mathbb{D})^{\operatorname{vop}}$  obtained in Proposition 2.3.

**Lemma 2.5.** Let  $\mathbb{D}$  be a double category with local reflexive coequalizers. There is an isomorphism  $\mathfrak{H}(\mathbb{M}_{od_{co}}(\mathbb{D})) \cong \mathfrak{H}(\mathbb{M}_{od}(\mathbb{D}))$ . Where?

Definition 2.6.
